

# NASA TECH BRIEF

NASA Tech Briefs are issued to summarize specific innovations derived from the U.S. space program, to encourage their commercial application. Copies are available to the public at 15 cents each from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

## Laboratory Pulse Modulator Uses Minority Carrier Storage Diodes

### The problem:

Solid-state modulators producing high peak power have been generally limited to those employing either magnetic compression techniques or pulse forming networks and are usually restricted to operation at a single pulse width and pulse repetition rate.

### The solution:

A pulse modulator capable of continuously variable pulse width over a 10 to 1 range of 1.0 microsecond to 0.1 microsecond and operation over a wide range of pulse repetition rates. Pulse width diversity is obtained by operating step-recovery diodes in the reverse conduction mode.

### How it's done:

The block diagram illustrates the various stages used in the storage diode modulator. The first stage is a multivibrator turned on by a 3.5 volt, 1 microsecond system input trigger. The multivibrator output pulse, variable in width from 5 to 50 microseconds, is coupled to an emitter-follower type isolation amplifier

whose output is directly coupled to SCR<sub>2</sub> that controls the charging current for the storage diode. The amplitude level of the gate trigger is approximately 5 volts, or about twice the minimum amplitude required. A second output from the isolation amplifier is inverted, differentiated, and used to trigger a blocking oscillator whose output is coincident with the multivibrator output trailing edge. Collector-base feed design of the blocking oscillator allows heavy loading without suppression regeneration. The output winding of the blocking oscillator is referenced to the cathode of the main discharge switch SCR<sub>1</sub> which provides the reverse storage diode current (load current). The gate output to SCR<sub>1</sub> is 10 volts to assure rapid turn on.
